

Introduction

This document describes the client-level data that would be required for a future, direct application of this study's methodology to STADIOEquities' own clients. The present study validates the concentration-risk modelling approach using SEC Form 13F institutional holdings data as a publicly available proxy, per the accompanying problem statement. The tables below represent the ideal dataset STADIOEquities would need to provide in order for this methodology to be applied directly to its own client base.

Table 1: Client Account Information

Purpose: This table provides the client-level identifiers, demographic context, and self-declared risk profile needed to (a) join with portfolio and transaction data via Client ID, and (b) compare each client's stated risk appetite against their observed portfolio behaviour, which is a key input for identifying potentially unsuitable investment activity.

Note: Client ID is the common join key used across all tables in this data request.

Column Name	Data Type	Example	Additional Information
Client ID	String, categorical	CLT00381902	Unique, anonymised identifier for each client. Must not contain any personal identifiable information (name, ID number, etc.).
Client age	Numeric, Integer	29	Age in years at account opening. If exact age cannot be shared, an age

Column Name	Data Type	Example	Additional Information
			band (e.g. "25-34") is acceptable.
Account open date	String, datetime	2023-04-12	Format: yyyy-MM-dd. Date the client's account was created
Client province	String, categorical	GP	One of South Africa's nine provinces: "GP", "WC", "KZN", "EC", "FS", "LP", "MP", "NC", "NW".
Stated risk appetite	String, categorical	Moderate	As captured at sign-up. Expected values: "Low", "Moderate", "High", or equivalent scale used internally.
Stated investment goal	String, categorical	Long-term growth	As captured at sign-up (e.g. "Long-term growth", "Short-term trading", "Retirement saving").
Account status	String, categorical	Active	One of "Active", "Dormant", "Closed"

Table 2: Portfolio Holdings

Purpose: This table provides the position-level holdings data needed to calculate each client's portfolio concentration (e.g. Herfindahl-Hirschman Index, top-holding percentage, number of distinct holdings) at a given point in time the core input for the concentration-risk model.

Note: Client ID is the join key linking this table back to Table 1.

Column name	Data type	Example	Additional information
Client ID	String, categorical	CLT00381902	Join key linking to Table 1 (Client Account Information).
Snapshot date	String, datetime	2025-06-30	Format: yyyy-MM-dd. The date on which this holding was recorded. Requested at monthly intervals as the primary cadence. If monthly data cannot be provided operationally, quarterly snapshots are an acceptable fallback. Monthly data can always be aggregated to

Column name	Data type	Example	Additional information
			quarterly for consistency with the study's proxy dataset, but quarterly data cannot be disaggregated to monthly, so monthly is strongly preferred.
Instrument ticker	String, categorical	NPN	The exchange ticker symbol of the held instrument.
Exchange	String, categorical	JSE	The exchange on which the instrument is listed (e.g. "JSE", "NYSE", "NASDAQ"). Required to disambiguate ticker symbols that may collide across exchanges, particularly for clients using STADIOEquities' offshore investing product.

Column name	Data type	Example	Additional information
Instrument name	String, categorical	Naspers Limited	Full name of the held instrument, for readability alongside the ticker.
Sector	String, categorical	Technology	Sector or industry classification of the instrument (e.g. GICS or JSE sector classification). Needed to calculate sector concentration.
Quantity held	Numeric, float	15.5	Number of units/shares held. Fractional values are expected, since STADIOEquities supports fractional share ownership.
Market value of holding (ZAR)	Numeric, float	4230.00	The Rand value of this specific holding as at the snapshot date.
Total portfolio value (ZAR)	Numeric, float	18500.00	Defined as the sum of all equity holdings' market value only, excluding uninvested cash

Column name	Data type	Example	Additional information
			balances. This definition is used for consistency with the study's proxy dataset (SEC Form 13F), which discloses equity positions only and does not include cash. Deliberately repeated across all holdings for a given client/date, this is intentional for ease of weight calculation (Market value of holding / Total portfolio value), not a data quality issue.

Table 3: Transaction History

Purpose: This table provides a record of buy/sell activity, enabling analysis of how quickly and through what pattern a client moves toward a concentrated position. If STADIOEquities offers a recurring or auto-invest feature, this table can also help distinguish deliberate, manually-driven concentration from passive concentration arising through automated recurring purchases, supporting a deeper behavioural analysis

beyond the scope of the present proxy-based study, which relies on point-in-time 13F holdings snapshots and does not include transaction-level data.

Note: Client ID is the join key linking this table back to Table 1.

Column name	Data type	Example	Additional information
Client ID	String, categorical	CLT00381902	Join key linking to Table 1 (Client Account Information).
Transaction ID	String, categorical	TXN00981233	Unique identifier for each individual transaction.
Transaction date	String, datetime	2025-06-14 10:32:00	Format: yyyy-MM-dd hh:mm:ss. The date and time the transaction was executed.
Transaction type	String, categorical	Buy	One of "Buy" or "Sell".
Order type	String, categorical	Manual	One of "Manual" or "Recurring/Auto-invest". Requested contingent on STADIOEquities offering a recurring/auto-invest feature; if no such feature exists, this column can be

Column name	Data type	Example	Additional information
			omitted. Intended to distinguish deliberate trading decisions from passive, automated accumulation.
Instrument ticker	String, categorical	NPN	The exchange ticker symbol of the instrument traded.
Exchange	String, categorical	JSE	The exchange on which the instrument is listed. Consistent with Table 2, required to disambiguate tickers across exchanges.
Quantity	Numeric, float	5.0	Number of units/shares bought or sold. Fractional values are expected.
Price per unit (ZAR)	Numeric, float	272.50	The price at which the transaction was executed per unit/share, converted to Rand at the execution-date exchange

Column name	Data type	Example	Additional information
			rate for consistency across JSE and offshore holdings.
Transaction value (ZAR)	Numeric, float	1362.50	Total value of the transaction (Quantity × Price per unit), in Rand, converted at the execution-date exchange rate.

Table 4: Support & Complaint History

Purpose: This table provides a record of client complaints and support interactions, particularly those relating to unsuitable investment or product choices, which can serve as a real-world outcome label, allowing the study's concentration-based risk indicators to eventually be validated against actual instances of client harm, once applied directly to STADIOEquities' own data. This table has no equivalent in the present proxy-based study, since SEC Form 13F data contains no complaint or support records; it belongs entirely to the future direct-application phase of this methodology.

Note: Client ID is the join key linking this table back to Table 1. STADIOEquities' current information indicates that support queries are typically logged as unstructured free text rather than pre-categorised, so this table requests the raw text as the primary field, with structured categorisation requested only where it already exists.

Column name	Data type	Example	Additional information
Client ID	String, categorical	CLT00381902	Join key linking to Table 1 (Client

Column name	Data type	Example	Additional information
			Account Information).
Complaint ID	String, categorical	CMP00234521	Unique identifier for each logged complaint or support ticket.
Date logged	String, datetime	2025-07-02	Format: yyyy-MM-dd. Date the complaint or ticket was raised.
Complaint text	String, free text	"I lost most of my savings after putting everything into one stock..."	The raw, free-text body of the client's complaint or support query, as logged. Requested as the primary field, since complaints may not currently be pre-categorised.
Complaint category	String, categorical	Unsuitable investment choice	Requested only if STADIOEquities already applies structured categorisation to complaints. If no such categorisation currently exists, this field may be left blank; categorisation could instead be derived from the free-text field above as part of this study's own analysis.
Related instrument ticker	String, categorical	NPN	If identifiable from the complaint, the ticker of the holding involved. May be left blank if not applicable or not stated.

Column name	Data type	Example	Additional information
Resolution outcome	String, categorical	Resolved – guidance provided	The outcome of the complaint, if tracked (e.g. "Resolved – guidance provided", "Resolved – compensation", "Escalated", "Unresolved").
